

How to create a presentation using XSL Transformations

Dominik Vasko

2019-04-11

What you will need

- * **Saxon**, a xslt processor
- * FOP, a xml:fo processor
- * *Stylesheets*, for your xslt transformation
- * XML, XSL editor, you can also use VIM, Emacs

Saxon

- * Input: xml file and xsl transformation
- * Output: another xml file(xml, xml:fo, xhtml, etc.)
- * Linting
- * Version 9.9
- * Java version, Windows, Linux

Logo of Saxonica

FOP

- * Input: xml:fo file
- * Output: pdf
- * Old

Logo of Apache

Used constructs

- * Title
- * Lists
- * Images
- * Mixture of Picture and Image

Lists

- * List-item construct in xml:fo
- * Unordered lists in xhtml

```
<fo:list-block font-family="{ $pdf-item-font-face }"  
  <xsl:for-each select="item">  
    <fo:list-item>  
      <fo:list-item-label>  
        <fo:block>  
          *  
        </fo:block>  
      </fo:list-item-label>  
      <fo:list-item-body start-indent="22pt">  
        <fo:block>  
          <xsl:value-of select="." />  
        </fo:block>  
      </fo:list-item-body>  
    </fo:list-item>  
  </xsl:for-each>  
</fo:list-block>
```

XML:FO List

Pictures

- * External-graphics in xml:fo
(png, gif, jpg)
- * XHTML - tag

```
<xsl:template match="picture">  
  <fo:block text-align="center" span="all">  
    <fo:external-graphic width="257mm" height="auto" content-width="scale-to-fit"/>  
  </fo:block>  
</xsl:template>
```

Using external images

Multicol

- * Document body has 2 columns by default fo:block
- * Span="all" can be used
- * For XHTML - <div> tags with floats

```
<xsl:template match="multicol/itemize">
  <fo:list-block font-family="Arial" font-size="22pt">
    <xsl:for-each select="item">
      <fo:list-item>
        <fo:list-item-label>
          <fo:block>
            *
          </fo:block>
        </fo:list-item-label>
        <fo:list-item-body start-indent="22pt">
          <fo:block>
            <xsl:value-of select="." />
          </fo:block>
        </fo:list-item-body>
      </fo:list-item>
    </xsl:for-each>
  </fo:list-block>
</xsl:template>
<xsl:template match="picture">
  <fo:block text-align="center" span="all">
    <fo:external-graphic width="257mm" height="auto" content-width="scale-to-fit" src="" />
  </fo:block>
</xsl:template>
<xsl:template match="multicol/picture">
  <fo:block text-align="center">
    <fo:external-graphic width="120mm" height="200mm" content-width="scale-to-fit" src="" />
  </fo:block>
</xsl:template>
</xsl:stylesheet>
```

Multiple columns

Validation

- * Relax NG
- * shemas
- * data types from XSD?
- * Jing

Custom parameters

- * Font size
- * Font face
- * Default page height

```
<!-- XHTML -->
<xsl:param name="xhtml-title-font-size" select="'40pt'"/>
<xsl:param name="xhtml-title-font-face" select="'Arial'"/>

<xsl:param name="xhtml-item-font-size" select="'18pt'"/>
<xsl:param name="xhtml-item-font-face" select="'Arial'"/>

<xsl:param name="xhtml-footer-font-size" select="'11pt'"/>
<xsl:param name="xhtml-footer-font-face" select="'Times'"/>

<xsl:param name="xhtml-default-slide-height" select="'500px'"/>
```

Customizable parameters

Files

- * xhtml for each slide
- * pdf
- * makefile for linux
- * .bat for windows

The result

The screenshot shows a presentation viewer window titled 'Presentation'. The address bar displays the file path: `file:///home/dominik/Desktop/xslt_tutorial/output`. The slide is titled 'Lists' and contains the following content:

Lists

- * List-item construct in xml:fo
- * Unordered lists in xhtml

```
<fo:list-block font-family="{pdf-item-font-face}"  
<xsl:for-each select="item">  
  <fo:list-item>  
    <fo:list-item-label>  
      <fo:block>  
        *  
      </fo:block>  
    </fo:list-item-label>  
    <fo:list-item-body start-indent="22pt">  
      <fo:block>  
        <xsl:value-of select="." />  
      </fo:block>  
    </fo:list-item-body>  
  </fo:list-item>  
</xsl:for-each>  
</fo:list-block>
```

Construct in
construct in
in
d lists in

```
<xsl:template match="multicol/itemize">  
  <fo:list-block font-family="Arial" font-size="22pt">  
    <xsl:for-each select="item">  
      <fo:list-item>  
        <fo:list-item-label>  
          <fo:block>  
            *  
          </fo:block>  
        </fo:list-item-label>  
        <fo:list-item-body start-indent="22pt">  
          <fo:block>  
            <xsl:value-of select="." />  
          </fo:block>  
        </fo:list-item-body>  
      </fo:list-item>  
    </xsl:for-each>  
  </fo:list-block>  
</xsl:template>  
<xsl:template match="picture">  
  <fo:block text-align="center" span="all">  
    <fo:external-graphic width="257mm" height="auto" content-width="scale-to-fit" sr<br/>  
</fo:block>  
</xsl:template>  
<xsl:template match="multicol/picture">  
  <fo:block text-align="center">  
    <fo:external-graphic width="128mm" height="298mm" content-width="scale-to-fit" s<br/>  
  </fo:block>  
</xsl:template>  
</xsl:stylesheet>
```

Same content in pdf and xhtml form
